

Campus Safety

Campuses are next only to airports in terms of camera density and have similar high-availability surveillance requirements.

A campus may have surveillance hardware components acquired over a long period from multiple manufacturers. Some, though functioning, may be obsolete and too expensive to replace. Also, campuses may have stringent firewall policies because of the high numbers of IT infrastructure users (i.e., the student community).

Any high-availability surveillance solution must thus function well across a range of product makes with manufacture dates spread over decades. It must also work under a strict firewall regimen.

Vega Systems' RMF solution delivers on all of these coordinate points.
